 A; Accession: AUI910 A; Molecule type: protein
A) Residues: 1-113 AAPP. C. Comment. This chain was isolated from a myeloma protein that binds phosphorylcholine.
C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kappanain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into landary in in
C; Superfamily: immunoglobulin V region; immunoglobulin homology

C/Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kapp hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into landing disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into landic Sysperfamally: immunoglobulin V region; immunoglobulin homology

A;Description: K+1+ dual receptor B cells are present in the human peripheral repertoire
A;Reference number: 849571
                                                                                                                                                                                                                                              Complex: An immunoglobulin heterotetramer subunit consists of two identical light (ket hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into lain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into laisulfide bonds. In some cases, such as IgA and IgM, the subunits associate into lockeywords: heterotetramer; immunoglobulin homology ckeywords: heterotetramer; immunoglobulin F;1-20/Domain: signal sequence #status predicted <SIG>F;21-133/Product: Ig kappa chain V-II region (RPMI) #status predicted <MAT>F;1-43/Region: framework IF F;4-59/Region: complementarity-determining IF F;6-74/Region: complementarity-determining 2

Johnson R.S. Jr., Ray W.C., Mang J., Forst C., Hood L.;
Johnson L., Nguyen D., Wang J., Forst C., Hood L.;
"The complete genome sequence of Haemophilus ducreyi.";
Submitted (JUN-2003) to the EMBL/GenBank/DDBJ databases.
-!- SIMILARITY: Belongs to the LilP family of ribosomal proteins.
Subfamily B.
                                                                                                                                       Bacteria, Proteobacteria, Gammaproteobacteria, Pasteurellales,
Pasteurellaceae, Haemophilus

Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis.

Claim 1; Page 40; 81pp; English.

This sequence represents complementarity determinating region 1 (CDR LI) of the light chain of murine anti-CD23 (FCERII) monoclonal antibody C11 (See also AAY32254). The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of C11 light and heavy chain CDRs (see AAY32254-59) to

N

render them capable of binding to the CD23 type II molecule expressed on hematopoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative collits, Crohn's disease, Sjogren's syndrome, allergies, allergic asthma, intrinsic asthma acute asthmatic exacerbation, rhinits, eczema, graft-versus-host disease, COPD, insulitis, bronchitis (particularly chronic bronchitis) or diabetes are also useful for studying interactions between CD23 and various ligands and determining the binding agents ; Length 16; 0; Indels 100.0%; Score 81; DB 3; L ilarity 100.0%; Pred. Region

The patent discloses a humanised antibody or its antigen-binding fragment, having binding specificity for CC-chemokine receptor 2 (CCR2), comprising an antigen binding region of non-human origin and at least a portion of an immunoglobulin of human origin. The humanised antibodies are useful for inhibiting the interaction of a cell expressing CCR2. They are useful for inhibiting or treating HIV infection. The proteins of the invention are useful for inhibiting leukocyte trafficking, for treating

ô CCR2-mediated disorders such as inflammatory disorder, autoimmune disorders such as rheumatoid arthritis and multiple sclerosis, at disorders such as rheumatoid arthritis and multiple sclerosis, at atherogenesis and atherosclerosis, and for inhibiting restenosis. They are useful in therapy or disquosis, and in the manufacture of a medicament for treating CCR-2 mediated disease. They are also useful for treating allergy, anaphylaxis, malignancy, chronic and acute inflammation, histamine and Ig2- mediated allergic reaction, shock, stenosis, allograft rejection, fibrotic disease, aethma, inflammatory glomerulopathies, acquired immune deficiency syndrome (AIDS), restenosis associated with vascular intervention, including angioplasty and/or stent inhibiting narrowing of the lumen of a vessel in a mammal, and inhibiting necoming marrowing of the lumen of a vessel in a mammal, and inhibiting medicinal hyperplasia of a wessel in a mammal, preferably associated with vascular intervention. The present sequence is mouse germline kappa urticaria, nephrotic syndrome; glomerulonephritis; disease; structure collits; Crohr's disease; Sjogren's syndrome; allergy, asthma; rhinitis; eczema; insulitis; graft-versus-host disease; COPD; bronchitis; diabetes; B-cell malignancy; Gaps CD23; FCERII; IgE receptor; monoclonal antibody; C11; mouse; human; monoclonal antibody; chimeric antibody; humanised antibody; complementarity determining region, CDR; autoimmune disease; inflammation; arthritis; lugus erythematosus; multiple sclerosis; Hashimoto's thyroiditis; diabetes; uveitis; dermatitis; psoriasis; . 0 100.0%; Score 81; DB 4; Length 100; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                           This sequence represents the light chain variable region (VL) of humanised anti-CD23 (FCERII) monoclonal antibody C11, composed of a human framework (HSIGKVII) and the light chain complementarity determining regions (see AAY32254-56) of murine antibody C11. The DNA was constructed by splice overlap PCR. The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino caid sequences of the C11 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arbhritis, lupus erythematosus, Hashimoto's thyroiditis, multiple carbritis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomeralopphritis, inflammatory bowel disease, ulcreative colitis, colitis, colophis, inflammatory bowel disease, ulcreating colitis, colitis, colophismatic exacerbation, rhinitis, eczema, graft-oversus-host disease, COPD, insultis, borochitis (particularly chronic bronchitis) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions controls and various ligands and determining the binding agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CD23; FCERII; IgE receptor; monoclonal antibody; Cl1; mouse; monoclonal antibody; chimeric antibody; humanised antibody; complementarity determining region; CDR; autoimmune disease; inflammation; arthritis; lupus erythematosus; multiple sclerosis; Hashimoco's thyroiditis; diabetes; uveitis; dermatitis; psoriasis; urticaria; nephrotic syndrome; glomerulonephritis; inflammatory bowel disease; ulcerative collitis; Crohn's disease; slogren's syndrome; allergy; asthma; thinitis; eczema; insulitis; graft-versus-host disease; COPD; bronchitis; diabetes; B-cell malignancy;

This sequence represents the light chain variable region (VL) of murine anti-CD23 (FCERII) monoclonal antibody C11. The invention provides altered antibodies, such as chimeric or humanised antibodies see attered antibodies, such as chimeric or humanised antibodies see ANY32262 and ANY32262 and ANY32263), which complise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining ceptons (see ANY3224-59) to render them capable of binding to the CD23 type II molecule expressed on haemacropoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple cof arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple cof arthritis, crohn's disease, glogren's syndrome, allergic asthma, collisis, crohn's disease, glogren's syndrome, allergies, allergic asthma, intrinsic asthma, acute asthmatic asthmatic asthma, acute asthmatic axacerbation, rhinitis, eczema, graft-collisis, crohn's disease, (COPD, insullitis, bronchitis (particularly chronic bernonchits) or diabetes (particularly type 1 diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions companies and various ligands and determining the binding agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis.

AAW39818-20 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 6A12, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H benzoic acid from 3H-phenyl cocaine. The 6A12 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 6A12 has a per minute Kcat of 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treatment addiction (by reducing the in vivo concentration that can be achieved)
                                                                                                                                                                                                                                                                                                                                                    New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in fassmaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 13; Page 81; 147pp; English

AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 2AlO antibody (AAW39809 benzoic acid from 3H-phenyl mas identified using TSAl, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2AlO has a per minute Koat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the

New catalytic antibodies able to decompose cocaine, single-chain

ö The present sequence represents the light chain of a catalytic antibody which is capable of degrading cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomes. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The particularly for the treatment of an overdose. They are also used treating addiction (by reducing the in vivo concentration that can be analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding. New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding. Variable domain, lambda light chain, catalytic antibody, degradation, cocaine, cocaine transition state analogue, TSA, benzoic acid, phenyl cocaine; immunogenic conjugate, reduction, cocaine; treatment, Gaps Variable domain of the Kappa light chain of catalytic antibody 2A10. ; 0 95.1%; Score 77; DB 2; Length 113; 93.8%; Pred. This is the light (kappa) - chain variable (V) region of a mouse monoclonal antibody (MAb), 2E12, and is specific for an HIV-1 viral haring wartigen. It is used in the construction of a chimeric MAb comprising heavy and light chains having murine V regions and human C regions. The chimeric MAbs are more effective than murine MAb 2E12 since they have an increased compatibility in humans. The heavy and light chain V-regions are joined by manipulating their respective joining (J) regions, to generate restriction enzyme recognition sites. The chimeric MAbs can be used as immuno- conjugates, in association with e.g. toxins for HIV reatment. They can also be used in diagnosis of HIV. See also AAQ12057-63. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct DR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New chimeric mouse-human antibodies - used to detect, kill and remove HIV -1 antigen from sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Variable domain, lambda light chain, catalytic antibody; degradation; cocaine, cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.

New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAW39824-26 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 12H1, which is able to degrade occaine. A series of occaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody was identified using TSAs, and has a per minute Kcat of 0.16. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Light chain CDR1 of catalytic antibody 3B9.

AAW39815-17 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 3B9, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-berzoic acid from 3H-phenyl cocaine. The 3B9 antibody was identified using TSAl, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are for treating addiction (by reducing the in vivo concentration that can be achieved)
                                                                                                                                                                                                                                                                                                                                                                                                                                   0
New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occanne. A series of cocaine transition state analogues (TSAS) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in fassmaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Variable domain, lambda light chain, catalytic antibody, degradation, cocaine, cocaine transition state analogue, TSA, benzoic acid, phenyl cocaine, immunogenic conjugate, reduction, cocaine, treatment, overdose, addiction.

A series of cocaine transition state analogues (TSAS) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl occaine. The particularly for the treatment of an overdose. They are also used particularly for the treatment of an overdose. They are also used for the treatment of an overdose. They are also used for the treatment of an overdose. They are also used for the treatment of an overdose.
benzoic acid from 3H-phenyl cocaine. The 12H1 antibody (AAW19808 represents the heavy chain) was identified using TSA2, and has a per minute Kcat of 0.016. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occaine. A series of cocaine translation state analogues (FGAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 6Al2 antibody (AAW39807 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of Apposphate monoseter transition state analogue. Antibody 6Al2 has a per minute Kcat of 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occasine. A series of cocaine transition state analogues (FSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 3B9 antibody (AAW39806 represents the heavy chain) was identified using TSAl, which is an immunogenic conjugate of a prosphate monoseter transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A,Title: kappa-Chain variable region from M167, a phosphorylcholine binding myeloma proté
A,Reference number: A01908; MUD:79000273; PMID:99160
A,Rofession: A01908
A,Rofecule rype: protein
A,Residues: 1-112 - RUD>
C,Comment: This chain was isolated from a myeloma protein that binds phosphorylcholine. 7
C,Complex: An immunoglobulin heteroteramer subunit consists of two identical light (kapp hain disulfide bonds: In some cases, such as IgA and IgM, the subunits associate into land; deperfamily: immunoglobulin V region; immunoglobulin homology
C,Reywords: heterotetramer
F,16-95/Domain: immunoglobulin homology <IMM>
F;23-93/Disulfide bonds: #status predicted

Cycomment: This chain was isolated from a myeloma protein that binds phosphorylcholine.
Cycomplex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into la Cysuperfamily: immunoglobulin V region; immunoglobulin homology

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- CATALYTIC ACTIVITY: NADH + ubiquinone = NAD(+) + ubiquinol.
-!- SUBCELLULAR LOCATION: Integral membrane protein. Mitochondrial
 -!- SIMILARITY: Belongs to the S3AE family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SEQUENCE FROM N.A.
